Case: A Targeted Discovery

ACME Pharmaceutical, a company on the rise in the industry was just about to break through with a world renowned drug that could see their company value sky rocket. The new drug, if approved, would make or break the company.
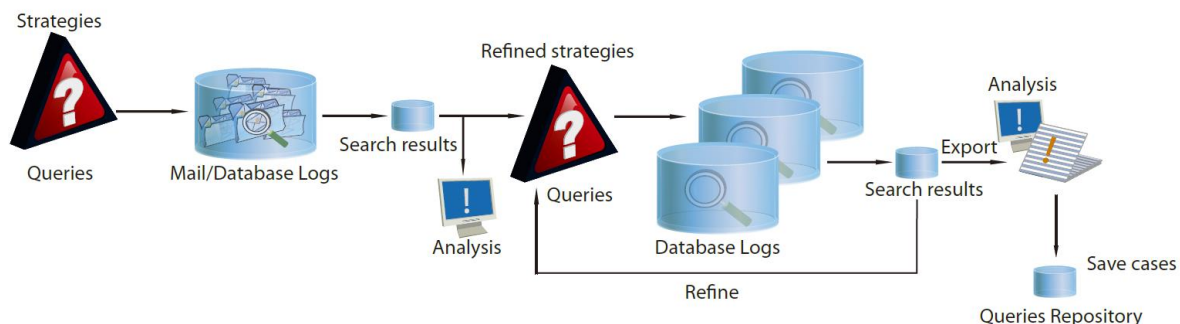

Just a few days before the new drug had been denied by the government health agency, the company saw 10,000 shares of company stock get sold off. This was of concern to Mr. John Smith, the CEO of the company. He suspected that there may be a case of insider trading happening right underneath his nose. He had his suspicions about which employee may have been involved, but he needed proof.

SecurSearch eDiscovery, a light weight eDiscovery engine for your HCL Domino e-mail environment, would prove to be a vital part of uncovering the truth.

SecurSearch gave ACME Pharmaceutical the ability to search through the suspected employee's emails. With the use of SecurSearch eDiscovery, many emails sent from the suspected employee to a person outside of the organization were discovered that revealed highly confidential information regarding the new drug along with the details that it was not going to be approved by the government health agency.

With the evidence discovered by SecurSearch, the company was able to prosecute the now former employee as well as the person to whom the information was passed to and ultimately benefited from the insider information. The evidence held up in court, and the two were criminally charged with insider trading.

SecurSearch enables you to run queries against mail databases and/or SecurTrac logs within your HCL Domino environment. With a choice between user pre-defined queries or with the use of the search formula wizard, SecurSearch can quickly find any inappropriate usage within your Domino environment.
